able amount of material is furnished by the Veterans Administration, and about 12 per cent is derived from civilian sources. There does not seem to be any significant difference in the picture of hepatitis in the material contributed from the various sources, except for the comparatively large amount of iron in the liver tissues of patients from the battle front. This is thought to be related to blood transfusions given to war casualties.

Relative to the question concerning the difference between fatal and nonfatal hepatitis, there is, of course, no fair comparison between biopsy and autopsy material. However, the histologic appearance of nonfatal

hepatitis seems entirely different from fatal hepatitis as seen in autopsies.

MARY MARCUS: Did you have any patients with leukemia and jaundice at the same time?

HANS F. SMETANA: There were occasional cases of leukemia which we were able to diagnose by biopsy. I don't remember whether there was icterus, but jaundice incidental to leukemia has been described.

MARY MARCUS: A fatal case of jaundice and leukemia occurred at the Jewish Hospital of Brooklyn this summer.

AWARD OF EDWARD N. GIBBS MEMORIAL PRIZE

The New York Academy of Medicine, on recommendation of the Gibbs Prize Committee, announces on June 2, 1952 the award of the Edward N. Gibbs Memorial Prize of \$2,000 for researches on the etiology, pathology, physiology or treatment of diseases of the kidney to Dr. John V. Taggart of the College of Physicians and Surgeons, Columbia University, for studies on renal physiology and tubular transport mechanisms.

It is of interest that this award, initiated in 1901 by Mrs. Edward N. Gibbs and Mrs. George Gibbs Sherrill in memory of Edward N. Gibbs and given at irregular intervals, has encouraged research in this field for over fifty years.

The Academy takes pleasure in announcing the 1952 award.
